

MIRA — Documentation Map

27 new docs committed 2026-06-07 · branch **docs/comprehensive-runbooks-2026-06-06** · commit 3654dc6a

Every load-bearing claim was verified against the codebase via CodeGraph + file reads and carries a file:line reference.

● VERIFIED	Fully verified against source. No caveats — trust as written.
● CAVEAT	Core content verified, but carries flagged UNVERIFIED items, or is a time-sensitive snapshot. Read the in-doc flags.
● CONFIRM	Contains material that must be confirmed by a human on a device we can't reach (PLC laptop). Architecture facts in it are still verified.

1 Runbooks — docs/runbooks/

Step-by-step ops procedures. Each has Prerequisites · exact commands · Expected output · What can go wrong.

Status	File	What it does
● VERIFIED	deploy-to-production.md	Full flow from merged PR → Smoke Test → deploy-vps.yml → VPS. Covers the hotfix bypass and the deploy-run-reports-failure-on-success gotcha.
● VERIFIED	vps-health-check.md	Check every container, disk, memory, swap on the VPS over SSH. Enumerates the expected container set; covers the 8 GB OOM failure mode.
● VERIFIED	merge-prs.md	Merge a PR safely. Only required check is <i>staging-gate</i> (ruleset); auto-merge is disabled; never merge through new red checks.
● VERIFIED	apply-migrations.md	dev → staging → prod migration workflow. Explains the two migration dirs and which one apply-migrations.yml actually runs.
● VERIFIED	fix-hub-502.md	Decision tree for app.factorylm.com 502 — crashed vs removed vs OOM-killed — routing to the right fix.
● VERIFIED	fix-hub-container-removed.md	The recurring 'container was removed' case. Why docker restart / self-healer can't fix it; the sanctioned deploy-vps recreate.
● CAVEAT	provision-ignition-hmac.md	Set up MIRA_IGNITION_HMAC_KEY for Ignition cloud chat. CAVEAT: whether factorylm.properties exists on the PLC laptop is unconfirmed.
● CONFIRM	reset-ignition-trial.md	Reset the Perspective 2-hour trial. Architecture constraint (laptop-only, CHARLIE HTTP-only) is verified; exact UI/service mechanics must be CONFIRMED on the laptop.
● VERIFIED	upload-manual-verify-citable.md	Upload a PDF and verify it's actually citable in chat. Documents the upload→knowledge_entries gap and which path makes a doc citable.
● CAVEAT	seed-demo-data.md	Seed the demo tenant for video recording. CAVEAT: demo-hub-tenant.sql referenced in README was absent on disk — verify before applying.
● VERIFIED	run-eval-suite.md	Run the offline eval (offline_run.py --suite text) and interpret results. Current pass rate 42/57; where runs land; the watch-set loop.
● VERIFIED	README.md	Index of all runbooks, grouped by the comprehensive core set + existing runbooks.

2 Workflows — docs/workflows/

End-to-end feature flows with exact file:line, function names, and the DB tables touched.

Status	File	What it does
● VERIFIED	pdf-upload-flow.md	PDF upload → Hub route → mira-ingest → Open WebUI KB → (gap) knowledge_entries. Traces chunk/embed/dedup and the not-citable gap.

Status	File	What it does
● VERIFIED	diagnostic-engine-flow.md	Question → intent classifier → UNS gate → RAG retrieval → cascade inference → grounded answer → citation compliance. engine.py:335/879/1296 verified.
● CAVEAT	tag-ingestion-flow.md	Ignition → HMAC batch → relay → tag_events → live_signal_cache freshness → Command Center. CAVEAT: approved_tags write path + flaky read path untraced.
● CAVEAT	cmms-sync-flow.md	Atlas CMMS ↔ NeonDB sync → work orders / PM → Hub. CAVEAT: assets schema, HTTP-429 handling, and conflict-review UI not fully traced.
● VERIFIED	connector-import-flow.md	External system → connector import → normalize → canonical → proposals → review. Clearly flags all five adapters as MOCKS.
● CAVEAT	knowledge-graph-flow.md	Entity/edge → proposals → evidence → admin approval → verified graph → traversal tools. CAVEAT: KG inference-worker path left for a future pass.
● CAVEAT	lead-discovery-flow.md	Cron → city rotation → web search → HubSpot dedup → create company → enrichment. CAVEAT: no Celery-beat/plist schedule entry found (real gap).
● VERIFIED	self-healer-flow.md	15-min cron → check containers → detect → restart/recreate → Telegram alert. Documents the verified recreate-gap bug + unmerged fix branch.
● VERIFIED	README.md	Index of all eight flows with the code entry point for each.

3 Architecture Reference — docs/architecture/

Static system reference: what's built, where, and what's real vs mock.

Status	File	What it does
● CAVEAT	container-map.md	Every container: port, network, compose file, mem limit, healthcheck, role — prod (saas) vs dev. CAVEAT: a few observability healthchecks unverified.
● CAVEAT	database-map.md	Every NeonDB table: who writes, who reads, which Hub page displays. CAVEAT: several display-surface readers not traced; corrected current_tag_state.
● VERIFIED	real-vs-simulated.md	Demo-credibility map: real production data vs mock vs bench-only. Connectors = mocks; lead-hunter = real; garage PLC = real-but-bench.
● VERIFIED	environment-quick-ref.md	dev / staging / prod quick card: Doppler config, Neon branch, bot token, VPS, safe-to-break, promotion order, prod-guard override.
● CAVEAT	branch-and-pr-status.md	Snapshot of main + ~40 open PRs grouped by theme. CAVEAT: by design a point-in-time snapshot — regenerate before trusting.
● VERIFIED	README.md	Index of the new reference set + pointers to the existing deep C4 / engine / ingest docs.

Bonus — the Real / Mock / Bench split (from real-vs-simulated.md)

Status	File	What it does
● VERIFIED	knowledge_entries (~25K OEM manual chunks)	REAL production data
● VERIFIED	Diagnostic engine (Groq→Cerebras→Gemini)	REAL — live LLM calls, no canned answers
● VERIFIED	Lead-hunter prospects (Serper / Hunter.io / HubSpot)	REAL — writes live CRM data

Status	File	What it does
● VERIFIED	Ignition tag stream (when HMAC + gateway live)	REAL — path-dependent; 503/404 if not provisioned
● CONFIRM	CMMS connectors: Maximo / SAP / MaintainX / PI / Ignition	MOCK — fixtures only, no live integration
● CONFIRM	Fault simulator (mira-fault-sim/sim.py)	SIMULATED — synthetic faults
● CAVEAT	Garage conveyor PLC reads (live_monitor / live-plc-bridge)	REAL reads, but BENCH-ONLY dev rig — not the shipped path
● CAVEAT	Demo-tenant Hub data + 'Coming Soon' pages	FABRICATED-but-labeled / placeholder

Here the colors mean the data, not the doc: **green** = real, **red** = mock/synthetic, **yellow** = real-but-bench or fabricated-but-labeled. This is the table to check before any recorded demo.
